

Overview

#Soil4Nature

Currently, the general awareness of regenerative agriculture is very low. In view of the deteriorating soil conditions in the EU region, we consider it important to raise awareness of sustainable practices contributing to soil recovery.

Soil4Nature partners has build a base of information on the current state of regenerative agriculture in Hungary, Slovakia and the EU region.

The database includes an overview and a list of literature on regenerative agriculture with key relevant information. Best practices will be collected as concrete examples of the application of regenerative agriculture principles in EU region.

The resulting database will serve as a knowledge base for the project partners, which will then be used in the production of WP4 outputs (brochure, videos/podcasts, digital farm).
